**Semester: Spring ..... / Fall ...2023.....**

**Student Name: Abid Hasan**

**Student ID: 221-35-1047**

**Batch: 37**

**Section: E**

**Course Code: SE 233**  
**Programming Lab**

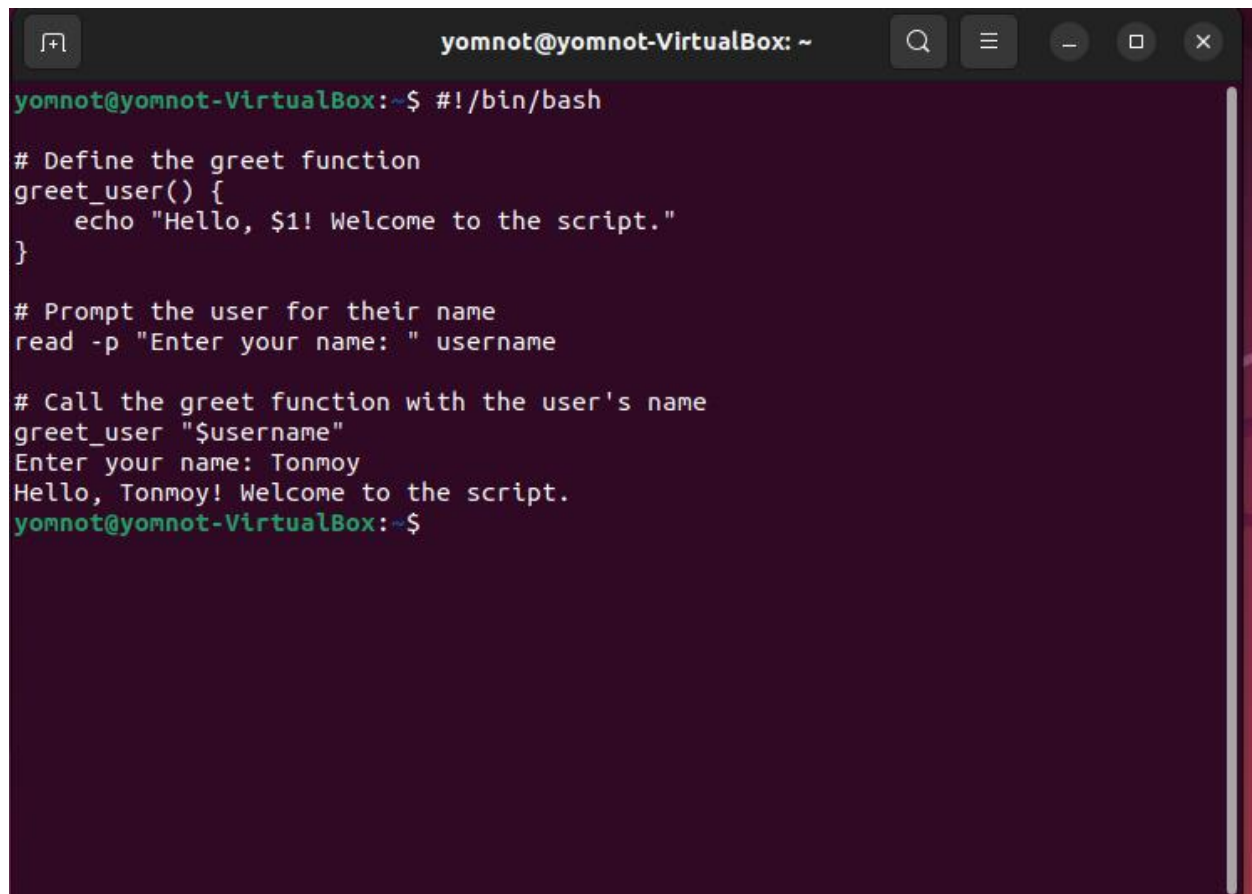

**Course Name: Operating System and System**

**Course Teacher Name: Ishrat Sultana**

**Designation: Lecturer    Department of Software Engineering**

## Lab Task 02

```
yomnot@yomnot-VirtualBox: ~  
yomnot@yomnot-VirtualBox:~$ #!/bin/bash  
  
# Prompt the user to enter a positive integer  
read -p "Enter a positive integer: " num  
  
# Validate if the input is a positive integer  
if [[ ! $num =~ ^[1-9][0-9]*$ ]]; then  
    echo "Invalid input. Please enter a positive integer."  
    exit 1  
fi  
  
# Initialize a counter  
counter=1  
  
# Use a while loop to print numbers, skipping even numbers  
while [ $counter -le $num ]; do  
    echo $counter  
    counter=$((counter + 2))  
done  
Enter a positive integer: 10  
1  
3  
5  
7  
9  
yomnot@yomnot-VirtualBox:~$
```

A terminal window titled "yomnot@yomnot-VirtualBox: ~" with standard window controls (search, menu, zoom, close). The terminal shows a Bash script being executed. The script defines a function "greet\_user" that prints a welcome message, prompts for a name, and then calls itself with the entered name. The user "Tonmoy" is entered, and the script outputs "Hello, Tonmoy! Welcome to the script." before returning to the prompt.

```
yomnot@yomnot-VirtualBox:~$ #!/bin/bash

# Define the greet function
greet_user() {
    echo "Hello, $1! Welcome to the script."
}

# Prompt the user for their name
read -p "Enter your name: " username

# Call the greet function with the user's name
greet_user "$username"
Enter your name: Tonmoy
Hello, Tonmoy! Welcome to the script.
yomnot@yomnot-VirtualBox:~$
```

```
yomnot@yomnot-VirtualBox: ~  
yomnot@yomnot-VirtualBox:~$ #!/bin/bash  
#!/bin/bash  
# Prompt the user to enter the array elements  
# Prompt the user to enter the array elements separated by spaces:"  
echo "Enter the floating-point numbers separated by spaces:"  
read -a numbers  
# Initialize sum and count variables  
# Initialize sum and count variables  
sum=0  
count=0  
# Loop through the array, summing the numbers and counting elements  
# Loop through the array, summing the numbers and counting elements  
for num in "${numbers[@]"; do bc  
    sum=$(echo "$sum + $num" | bc)  
    count=$((count + 1))  
done  
# Calculate the average with precision  
# Calculate the average with precision  
if [ "$count" -gt 0 ]; then; $sum / $count" | bc)  
    average=$(echo "scale=2; $sum / $count" | bc)rs is: $average"  
    echo "The average of the floating-point numbers is: $average"  
else  
    echo "No valid numbers entered. Cannot calculate the average."  
    echo "No valid numbers entered. Cannot calculate the average."  
fi  
Enter the floating-point numbers separated by spaces:  
1 2 3 4 5 6 7 8 9 10  
The average of the floating-point numbers is: 5.50
```

```
yomnot@yomnot-VirtualBox: ~  
yomnot@yomnot-VirtualBox:~$ #!/bin/bash  
  
# Prompt the user to enter the array elements  
echo "Enter the numbers separated by spaces:"  
read -a numbers  
  
# Calculate the sum of numbers  
sum=0  
for num in "${numbers[@]"; do  
    sum=$((sum + num))  
done  
  
# Calculate the average  
num_elements=${#numbers[@]}  
average=$(echo "scale=2; $sum / $num_elements" | bc)  
  
# Display the result  
echo "The average of the numbers is: $average"  
Enter the numbers separated by spaces:  
10 20 30 40 50  
The average of the numbers is: 30.00
```

```
yomnot@yomnot-VirtualBox: ~  
yomnot@yomnot-VirtualBox:~$ #!/bin/bash  
  
# Prompt the user for the limit  
read -p "Enter the limit: " limit  
  
# Initialize sum to 0  
sum=0  
  
# Use a for loop to iterate from 1 to the user-defined limit  
for ((i=1; i<=limit; i++)); do  
    # Add the current number to the sum  
    sum=$((sum + i))  
done  
  
# Display the result  
echo "The sum of numbers from 1 to $limit is: $sum"  
Enter the limit: 5  
The sum of numbers from 1 to 5 is: 15
```
